

# True PCI User's Manual

Design Gateway Co., Ltd.

*Rev 1.1*

*(PD0402-6-00-2E)*

\*\*\* Please read this manual carefully before using True PCI \*\*\*

## Revision History

Revision	Date	Detail of change
1.0	11 February 2005	Initial Release
1.1	6 May 2005	To update user interface code is able to read the DIP-Switch's value, and is able to display the output data on LED.

## Table of Contents

## 1. Introduction

Thank you very much for purchasing True PCI Starter Kit. Please check that all the following items are in the box. If anything is missing or damaged, contact your distributor or Design Gateway Co.,Ltd.

1. True PCI Card
2. User's Manual
3. CD ROM contains:
  - True PCI core (pciif32.ngc and pciif32.vhd)
  - Example VHDL source code (UserInterface.vhd, TruePCI.vhd and Memory.vhd)
  - Pin Assignment for example VHDL source code (truepci.ucf)
  - Configuration file (truepci.bit and truepci.mcs)
  - Test Bench (PKTbPCIIF32.vhd, PkTestBench.vhd, PkTestPattern.vhd and TbTruePCI.vhd)
  - Schematic (TruePCIRRev1\_2.pdf)
  - Demo Application (TruePCI.exe)
  - Dynamic Link Library for Demo Application (InStepPciDll.dll)
  - Application Source Code
  - Device Driver (InStepPciDrv.inf and InStepPciDrv.sys)
  - User's Manual

True PCI is a development PCI starter kit that provides a complete solution for design and application based on Xilinx Spartan-3 family. The kit is suitable for users who is not familiar with PCI protocol but would like to connect user's board to PCI slot on computer.

True PCI utilizes 200,000 system gates Spartan-3 device (XC3S200), High gate density and large number of GPIOs allow complete solutions to be implemented in advance design on FPGA. True PCI card provides 72 I/Os for general purpose input / output (GPIO). This GPIO support both +2.5V and +3.3V input. True PCI card has 4 LEDs, 2 push buttons and an 8-Bit DIP-Switch for general purpose.

### 1.1. Summary Feature

1. Spartan-3 device 200,000 system gates (XC3S200)
2. +3.3V, 32 bits, 33MHz PCI Interface for PC slot-based development
3. JTAG configuration
4. 72 General Purpose I/O
5. 4 LEDs indicator, 2 Push Buttons switch and 1 8-bit DIP-Switch

## 1.2. Minimum System Requirement

1. Pentium II or compatible processor (recommend Pentium III)
2. RAM 128 MB (recommend 256 MB)
3. Windows XP or Windows 2000
4. +3.3V, 32 bits, 33MHz PCI slot

## 1.3. Software Requirement

1. Xilinx ISE webpack for FPGA designer
2. Model Sim for FPGA designer
3. Microsoft Visual Studio.NET (Visual C++ .NET) for application designer

## 1.4. Warranty Policy

1. Product warranty is valid for 6 months from purchasing date.
2. Warranty is void if any modification has been made to this product and any incorrect operation from this manual or warranty sticker is torn or damaged.
3. In order to claim for product exchange or technical support within warranty period, official receipt is required for unregistered customer as an evidence of purchasing whereas official receipt is unnecessary for registered customer (please fill up registration card attached herewith the product and send back to Design Gateway Co.,Ltd).

## 1.5. Customer Support

Customer can contact to [support@design-gateway.com](mailto:support@design-gateway.com) for support of any problem about True PCI or visit our website at [www.design-gateway.com](http://www.design-gateway.com).

## 2. TruePCI System

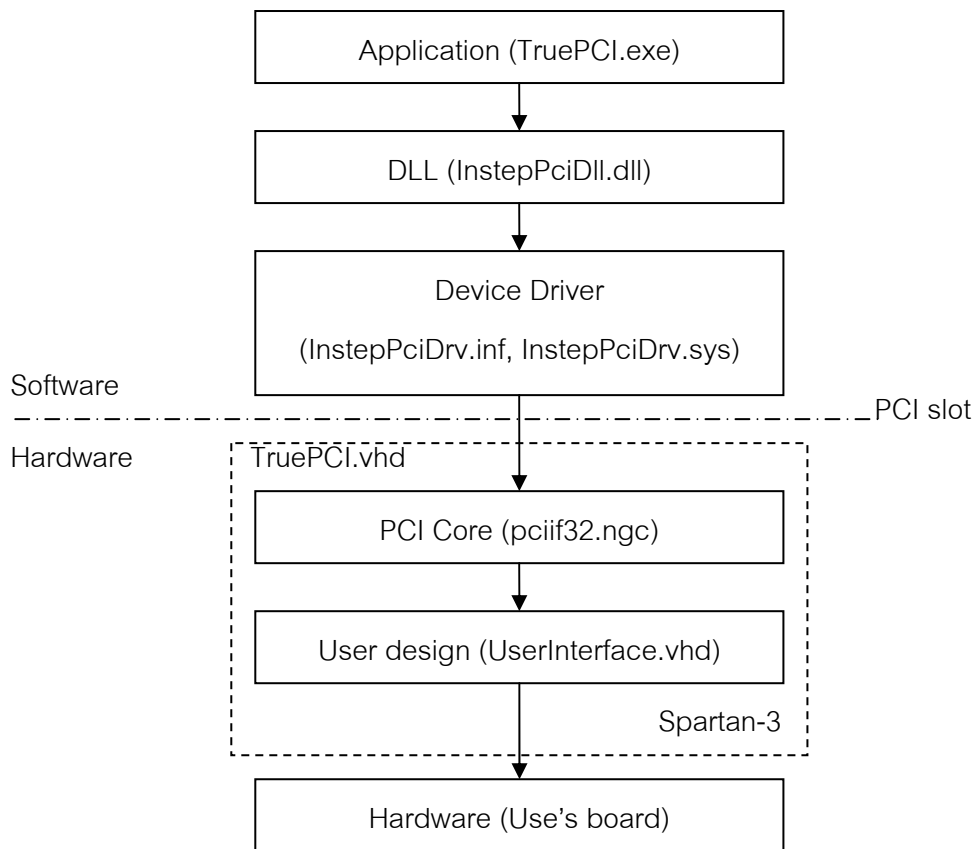

Figure 2-1 True PCI System

From above flowchart, True PCI system consists of software and hardware. Software is application (True PCI), DLL (InstepPciDll.dll) and Device Driver (InstepPciDrv.inf and InstepPciDrv.sys). Hardware is PCI core (pciif32.ngc) and user's design (UserInterface.vhd). Design Gateway Co.,Ltd recommends users do not change DLL, Device Driver and PCI core. For application and FPGA user's design, Users can design new one by reference from TruePCI.exe and UserInterface.vhd

### 3. Hardware Description

Figure 3-1 shows True PCI starter kit and its feature

Figure 3-1 True PCI Card

#### 3.1. True PCI Startrt Kit Description

A high-level block diagram of True PCI Starter kit is shown in Figure 3-2 followed by a brief description of each section.

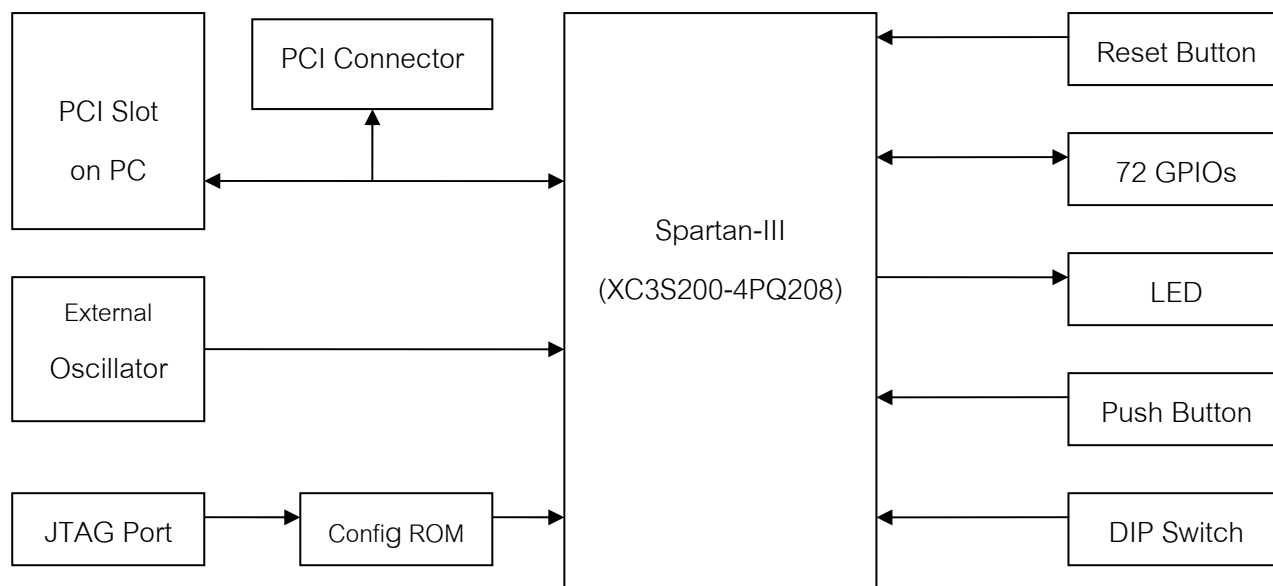

Figure 3-2 Block Diagram of True PCI Starter Kit

### 3.2. PCI Connector

This connector (CON2) shows all signals from PCI slot. The following table shows pin assignment on PCI connector.

Table 3-1 Pin assignment on PCI connector (CON2)

Pin No.	PCI Signal Name	Spartan-3 Pin	Pin No.	PCI Signal Name	Spartan-3 Pin
1	INTA#	P197	2	INTB#	NC
3	INTD#	NC	4	INTC#	NC
5	PRSNT1#	NC	6	PRSNT2#	NC
7	RST#	P183	8	CLK	P184
9	GNT#	P200	10	REQ#	P203

41	C/BE#[1]	P36	42	AD[15]	P37
43	AD[14]	P39	44	AD[13]	P40
45	AD[12]	P42	46	AD[11]	P43
47	AD[10]	P44	48	AD[9]	P45
49	AD[8]	P46	50	C/BE#[0]	P48
51	AD[7]	P50	52	AD[6]	P51
53	AD[5]	P52	54	AD[4]	P57
55	AD[3]	P58	56	AD[2]	P61
57	AD[1]	P62	58	AD[0]	P63

NC = this pin does not connect to Xilinx Spartan-3

Note:

1. ACK64 and REQ64 signal use for 64-bit PCI slot.
2. JTAG signal (TRST, TCK, TMS, TDO, TDI) from PCI slot do not connect to JTAG Connector.

### 3.3. Clock Generator

True PCI card can receive clock from 2 sources

- PCI Clock: This clock is generated from PC via PCI slot. It is running at 33 MHz
- External Clock: On True PCI card provide oscillator socket (OSC1). Users can use both half size and full size oscillator. This socket support only +3.3V oscillator.

The following table shows master clock assignment on True PCI card.

Table 3-2 Masters clock assignment on True PCI card

Clock Generator	Spartan-3 pin
PCI Clock	P184
External Clock	P79

### 3.4. Reset Circuit

True PCI can receive reset signal from 2 sources

- PCI Reset: This reset signal is generated from PC via PCI slot. Normally this signal is reset when turn on PC.
- External Reset: This reset signal is generated from external reset circuit.

The reset circuit will monitor +3.3V on True PCI. When the +3.3V falls below +2.7V, this circuit will assert reset signal (low logic level) to Spartan-3. In addition to monitoring +3.3V, the reset circuit can generate reset pulse by press reset button on True PCI. The reset signal is a fixed 230 ms active low pulse. The following figure shows reset signal timing diagram.

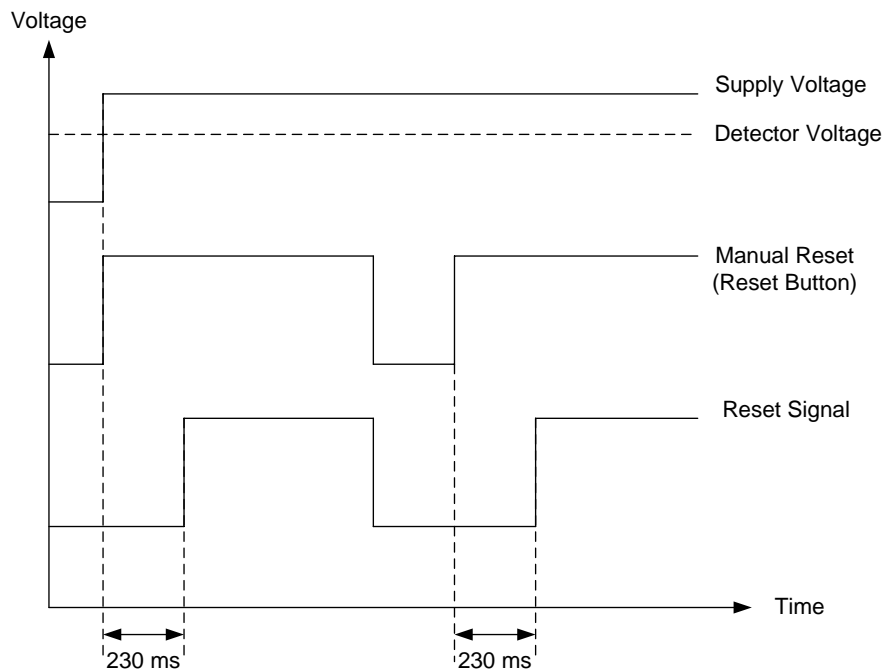

Figure 3-3 Reset Signal Timing Diagram

Table 3-3 Reset signal on True PCI

Reset Signal	Spartan-3 Pin
PCI Reset	P183
Reset Circuit	P156

### 3.5. DIP switch (SW1)

True PCI provides 8-position DIP switch input. This switch can set to a low or high logic level. Table 3-4 shows logic level on 8-position DIP switch and table 3-5 shows pin assignment from 8-position DIP switch to Spartan-3

Table 3-4 Logic level defines on 8-position DIP switch.

DIP switch setting	Logic Level
ON	Low
OFF	High

Table 3-5 8-position DIP switch assignment

Signal Name	Spartan-3 Pin	Description
DIP8	P115	DIP switch input 8
DIP7	P114	DIP switch input 7
DIP6	P113	DIP switch input 6
DIP5	P111	DIP switch input 5
DIP4	P109	DIP switch input 4
DIP3	P108	DIP switch input 3
DIP2	P107	DIP switch input 2
DIP1	P106	DIP switch input 1

### 3.6. Push Button Switch (PB1 and PB2)

True PCI provides two push button switches to Spartan-3. Each push button switch generates active low signal. The following table shows pin assignment from push button to Spartan-3

Table 3-6 Push button switch assignment

Push Button	Spartan-3 Pin
PB1	P149
PB2	P148

### 3.7. LED

True PCI provides 4 LEDs for users. Each LED is active low. The following table shows pin assignment from LED to Spartan-3

Table 3-7 LED assignment

LED No.	Spartan-3 Pin
LED1	P155
LED2	P154
LED3	P152
LED4	P150

Note:

DONE's LED monitors status in configuration process. While Spartan-3 is configured, DONE's LED should be bright. When configuration Spartan-3 complete, DONE's LED should be off.

### 3.8. 72 GPIOs

True PCI provides 3 GPIO connectors (CON6, CON7 and CON8) and each connector have 24-bit GPIO pins. Users can use all GPIOs both input and output. All GPIOs connect directly to Spartan-III and each GPIO pin supports only +3.3V tolerant input. Users must carefully connecting GPIO pin to user's board. The following table shows pin assignment from each GPIO connector to Spartan-3

Table 3-8 Pin assignment at GPIO connector (CON6)

Pin No.	Spartan-3 Pin	Pin No.	Spartan-3 Pin
1	+5V	2	+5V
3	P161	4	P162
5	P165	6	P166
7	P167	8	P168
9	P169	10	P171
11	P172	12	P175
13	P176	14	P178
15	GND	16	GND
17	P180	18	P181
19	P182	20	P185
21	P187	22	P189
23	P190	24	P191
25	P194	26	P196
27	P198	28	P199
29	GND	30	GND

Table 3-9 Pin assignment at GPIO connector (CON7)

Pin No.	Spartan-3 Pin	Pin No.	Spartan-3 Pin
1	+5V	2	+5V
3	P147	4	P146
5	P144	6	P143
7	P141	8	P140
9	P139	10	P138
11	P137	12	P135
13	P133	14	P132
15	GND	16	GND
17	P131	18	P130
19	P128	20	P126

Table 3-9 Pin assignment at GPIO connector (CON7) (continued)

Pin No.	Spartan-3 Pin	Pin No.	Spartan-3 Pin
21	P125	22	P124
23	P123	24	P122
25	P120	26	P119
27	P117	28	P116
29	GND	30	GND

Table 3-10 Pin assignment at GPIO connector (CON8)

Pin No.	Spartan-3 Pin	Pin No.	Spartan-3 Pin
1	+5V	2	+5V
3	P102	4	P101
5	P100	6	P97
7	P96	8	P95
9	P94	10	P93
11	P90	12	P87
13	P86	14	P85
15	GND	16	GND
17	P80	18	P81
19	P78	20	P77
21	P76	22	P74
23	P72	24	P71
25	P68	26	P67
27	P65	28	P64
29	GND	30	GND

VCCO for connector CON6 and CON8 are fixed at +3.3V, so output voltage from GPIO pin at connector CON6 and CON8 is +3.3V. VCCO for connector CON7, users can select from JP3 (between +2.5V and +3.3V). The following table shows VCCO jumper setting.

Table 3-11 VCCO jumper setting (JP3)

VCCO for CON7	JP3	
	1-2	2-3
+2.5V	Open	Closed
+3.3V	Closed	Open

### 3.9. JTAG Port

True PCI provides JTAG connector that programs the on-board PROM (XCF01S) and configures Spartan-3 (XC3S200). Users can use download cable from Xilinx to program PROM and configure Spartan-3. In addition to download cable, users can use JtagLink or Universal Download Cable from Design Gateway Co.,Ltd. The following table shows JTAG connector pin assignment.

Table 3-12 JTAG pin assignment

Pin No.	JTAG Signal	Pin No.	JTAG Signal
1	TCK	2	GND
3	TDO	4	+3.3V
5	TMS	6	-
7	DONE (Optional)	8	-
9	TDI	10	GND

Note:

DONE signal on pin 7 is optional signal that is for JtagLink only not for other download cable.

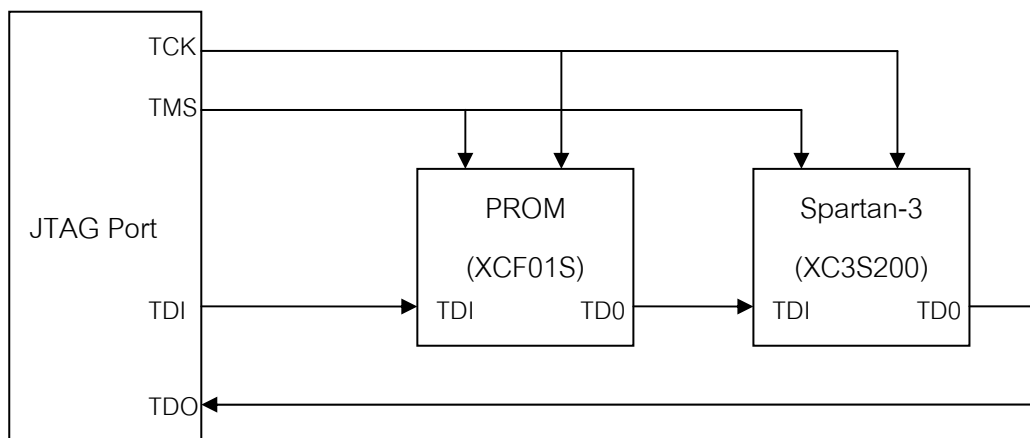

Figure 3-4 True PCI JTAG Chain

## 4. Firmware Description

### 4.1. True PCI Core

Design Gateway Co.,Ltd provides 32 bit PCI core interface for Spartan-3 FPGA on True PCI card. This PCI core manages signal between PC side (PCI slot) and user's side (local bus). Figure 4-1 shows block diagram of PCI core.

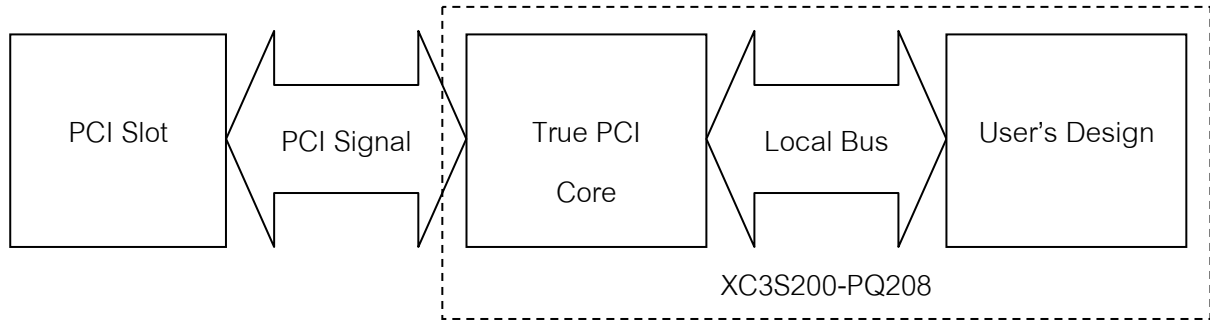

Figure 4-1 Block Diagram of PCI Core.

True PCI core provides "Local Bus" that is standard memory interface. So users do not need to know PCI protocol. Users need to know only local bus timing that provides in this manual. Figure 4-2 shows signal's direction in local bus interface.

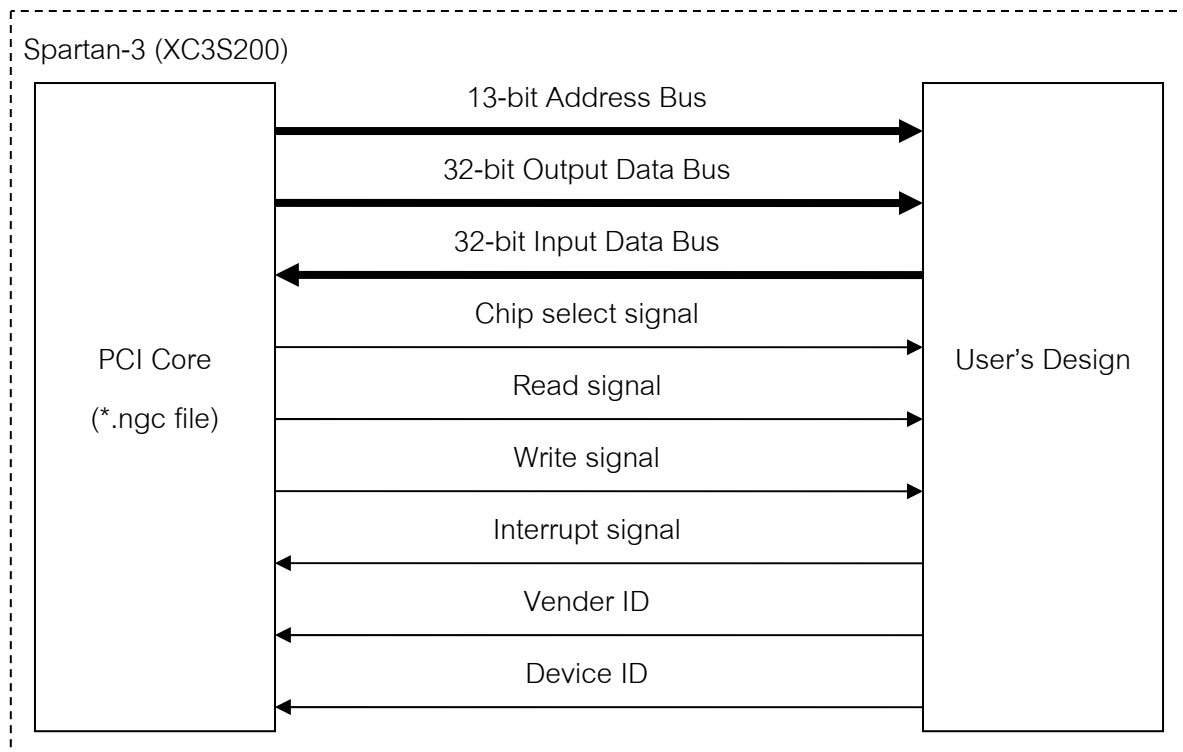

Figure 4-2 Local Bus Interface

- 13-bit Address signal (lbaddr[14:2]): This is PCI address. True PCI core provides PCI address from bit 2 to bit 14 because PCI data bus is 32-bit access. When users access one time, users can get 4-byte data.
- 32-bit Input Data signal (lbdatain[31:0])
- 32-bit Output Data signal (lbdataout[31:0])
- Read signal, active low level (lbrdb)
- Write signal, active low level (lbwrb)
- Chip Select signal, active low level (lbcsb)
- Interrupt signal, active high level (lbint)
- Vender ID signal, default value 0xF0F0
- Device ID signal, default value 0xF0F0

Local bus timing is shown in figure 4-3 and 4-4. In figure 4-3 (a) and (b) show local bus read timing and figure 4-4 (a) and (b) show local bus write timing.

(a)

(b)

Figure 4-3 Local Bus Read Timing.

### Local Bus Read Process

Figure 4-3 shows read process at address 0x000C (0000-0000-0000-1100). In local bus address should be show address 0x0003 (000-0000-0000-11). True PCI core send address (0x0003) to local bus address (lbaddr) after that 30 ns True PCI core force chip select signal and read signal to low level and hold at low level 60 ns before force chip select signal (lbcsb) and read signal (lbrdb) to high level again. After chip select signal (lbcsb) and read signal (lbrdb) hold in low level 30 ns, True PCI core get data from Input Data Bus (lbdatain). So it is mean data from users must be stable within 30 ns after chip select signal (lbcsb) and read signal (lbrdb) go to low level.

(a)

(b)

Figure 4-4 Local Bus Writes Timing.

### Local Bus Write Process

Figure 4-4 shown writes process at address 0x000C by value 0x00007777. True PCI core sends address (0x0003) to local bus address (lbaddr) and after 1 ns sends data (0x00007777) to local output data bus (lbdataout) after 29 ns True PCI core force chip select signal (lbcsb) and write signal (lbwrb) to low level and hold at low level 60 ns before force chip select signal (lbcsb) and write signal

(lbwr) to high level again. Users can get data while chip select signal (lbcsb) and write signal (lbwr) stay at low level.

Design Gateway Co.,Ltd provides True PCI core in \*.ngc file (pciif32.ngc in CD-ROM). This file can be added into ISE software from Xilinx.

## 4.2. Example VHDL design with True PCI core

### 4.2.1 UserInterface Block diagram

Design Gateway Co.,Ltd provide example VHDL design with True PCI core. This example VHDL is UserInterface. The following figure shown block diagram of example VHDL design.

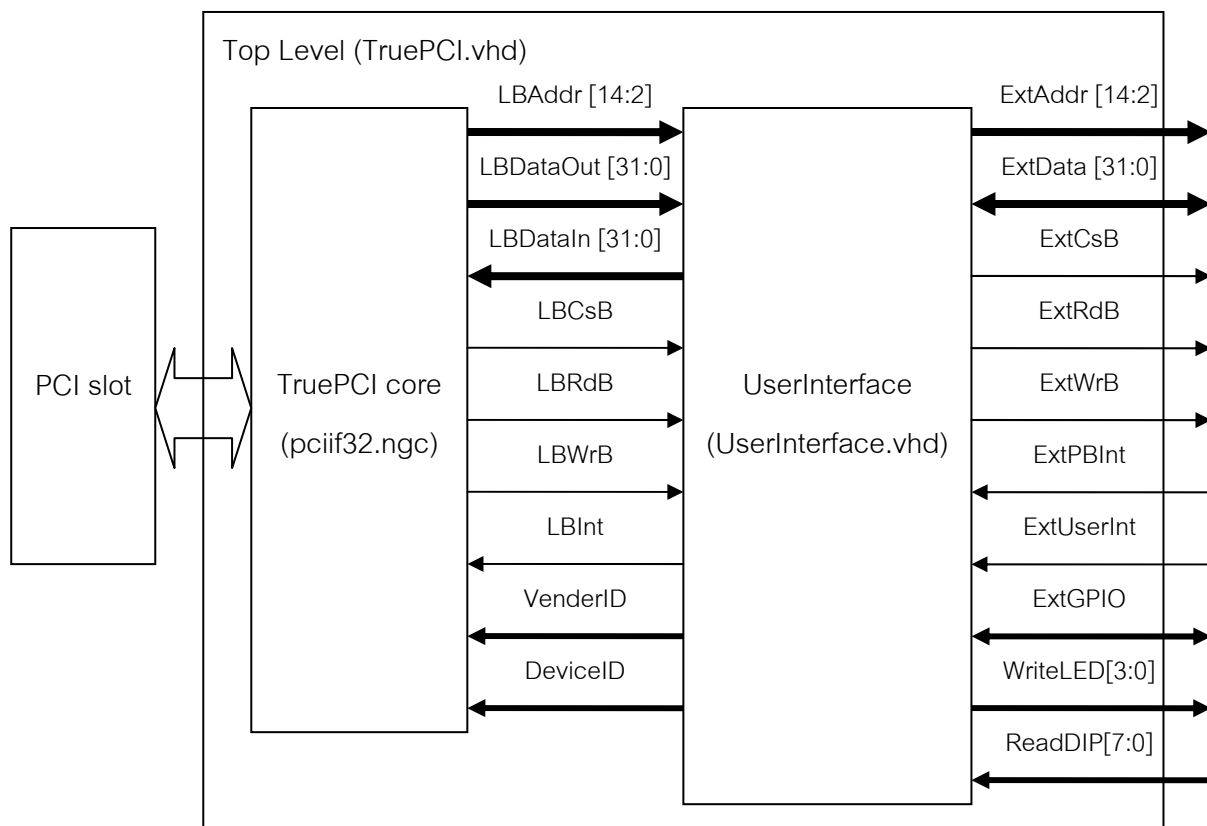

Figure 4-5 Example VHDL Design Block Diagram

UserInterface is example VHDL design connecting with True PCI core. This module manages signal between True PCI core and external signal. The external signals are mapping to connector (CON6, CON7 and CON8) and detail of external signals is

- External Address (ExtAddr [14:2]): This external address bus is the same signal as local bus address.
- External Data (ExtData [31:0]): This external data bus is bidirection. UserInterface control external data bus direction. When read process, UserInterface reads data from external data bus (ExtData) and sends data to local bus input data (LBDataIn). When write process, UserInterface write data from local bus output data (LBDataOut) to external data bus (ExtData).
- External Chip Select (ExtCsB): This external chip select is the same signal as local bus chip select (LBCsB).
- External Read (ExtRdB): This external read signal is the same signal as local bus read signal (LBRdB).
- External Write (ExtWrB): This external write signal is the same signal as local bus write signal (LBWrB).
- External Push Button Interrupt (ExtPBInt), active low level: This is an interrupt signal from push button (PB2).
- External User's Interrupt, active low level: This interrupt signal receives from user's board by pin 23 on CON6.
- External GPIO (ExtGPIO [15:0]): This is GPIO signal. Users can read or write data to each GPIO that is free from others. GPIO signal uses address 0x0004 to control GPIO direction and address 0x0008 for read/write data.
- Write LED (WriteLED[3..0]): These are signals used to control LED1 to LED 4 of True PCI Card. Users are able to control them, which, writing the 4 last LSB, the address 0x000C are defined for control data.
- Read DIP-Switch(DIP-Switch[7:0]): These are reading signal used to read the input of DIP-Switch. Users are able to read the DIP Switch values through the address 0x000C.

Users can change VendorID and DeviceID in this code. While operate system, both of ID must be fix value.

#### 4.2.2 Internal Register in UserInterface

In UserInterface has 3 control register

1. Interrupt register: This register maps to address 0x0000 in user's space. In address 0x0000, Bit 1 is interrupt enable, bit 0 is interrupt flag and another bit do not use. The following table shown description of interrupt register

Table 4-1 Interrupt Register

Bit	Logic Level	Descriptions
1	0	disable external interrupt
	1	enable external interrupt
0	0	no external interrupt occurred
	1	external interrupt occurred

Users can enable interrupt register by writing data 0x00000002 to address 0x0000. On the other hand, users can disable interrupt register by writing data 0x00000000 to address 0x0000. When external interrupt occurred bit 0 at address 0x0000 is set to high level (logic '1'). Users can clear this interrupt by writing data 0x00000002 to address 0x0000.

Note

- Users can clear external interrupt all time, although external interrupt is disable.
  - Design Gateway Co.,Ltd recommends users to use address 0x0000 for interrupt register because in device driver map address 0x0000 for external interrupt. When external interrupt occurred, device driver will automatically get and clear external interrupt.
  - UserInterface receives external interrupt from 2 sources: External Push Button Interrupt (ExtPBInt) and External User's Interrupt (ExtUserInt).
2. GPIO direction register: This register maps to address 0x0004 and use from bit 0 to bit 15. The following table shows GPIO direction.

Table 4-2 GPIO Direction

Logic	Direction
0	Input
1	Output

3. GPIO data register: This register maps to address 0x0008 and use from bit 0 to bit 15. This registers uses with GPIO direction. If GPIO direction set to input, users can read 16-bit data

from GPIO pin at this register. And if GPIO direction set to output, users can write 16-bit data to GPIO pin at this register.

Note

- Each GPIO pins do not depend on each other. Users can freely control each GPIO pin.
4. DIP- Switch registers: These registers are established on the address 0x000C. From LSB to MSB registers, they are used to read the value of DIP-Switch on the True-PCI.

In example VHDL code, Design Gateway provides source code and configuration file. Users can use them without any modification. FPGA folder in CD-ROM contains:

- UserInterface.vhd, TruePCI.vhd and Memory.vhd is example source code file.
- truepci.ucf is pin assignment file.
- truepci.bit is configuration file for Spartan-3 (XC3S200-PQ208)
- truepci.mcs is configuration file for PROMs (XCF01S)
- PKTbPCIIF32.vhd, PkTestBench.vhd, PkTestPattern.vhd and TbTruePCI.vhd is Test Bench file for simulation
- pciif32.vhd is True PCI core for simulation
- pciif32.ngc is True PCI core for synthesis and implement

Both configuration files are map signal to connector (CON6, CON7 and CON8). The following table shows pin assignment on connector (CON6, CON7 and CON8)

Table 4-3 Pin assignment on connectors CON6

Pin no.	Spartan-3 Pin	UserInterface signal	Description
1	-	-	+5V
2	-	-	+5V
3	P161	ExtData[31]	External Data Bus bit 31
4	P162	ExtData[30]	External Data Bus bit 30
5	P165	ExtData[29]	External Data Bus bit 29
6	P166	ExtData[28]	External Data Bus bit 28
7	P167	ExtData[27]	External Data Bus bit 27
8	P168	ExtData[26]	External Data Bus bit 26
9	P169	ExtData[25]	External Data Bus bit 25
10	P171	ExtData[24]	External Data Bus bit 24
11	P172	ExtRdB	External Read signal, active low level.
12	P175	ExtWrB	External Write signal, active low level.
13	P176	ExtAddr[14]	External Address Bus bit 14
14	P178	ExtAddr[13]	External Address Bus bit 13

28	P64	-	-
29	-	-	Ground
30	-	-	Ground

Note:

- When users use GPIO, JP3 should be set to +3.3V (recommended).

#### 4.3. Vender ID and Device ID Changing

Vender ID and Device ID of True PCI are fixed to 0xF0F0, however users can change both of them. If users want to change Vender ID and Device ID, users must change in UserInterface.vhd near Output Assignment and in InStepPciDrv.inf in this line.

```
%InStepPciDrv%=InStepPciDrv.Install, PCI\VEN_F0F0&DEV_F0F0
```

Vender ID, Device ID in InStepPciDrv.inf and Vender ID, Device ID in UserInterface.vhd must have same value. If these values are not the same, application can not access to True PCI core.

#### 4.4. The True PCI configuration

For the FPGA configuration on True PCI, it directly impacts to the Base address of the True PCI card which its' configuration is disappeared. From this event, True PCI software is unable to read or to write the data from True PCI Card, therefore users necessitates to restart the machine after reconfiguration.

### 5. True PCI Demo Application

TruePCI.exe is demonstration application to access read/write data to True PCI card. Users can use this application without modification of application. On the other hand, users can develop new application with reference from True PCI demo application. *This application is developed on Visual C++ .NET. So Design Gateway Co.,Ltd recommends users to develop application on Microsoft Visual Studio.NET.* Figure 5-1 shows True PCI demo application.

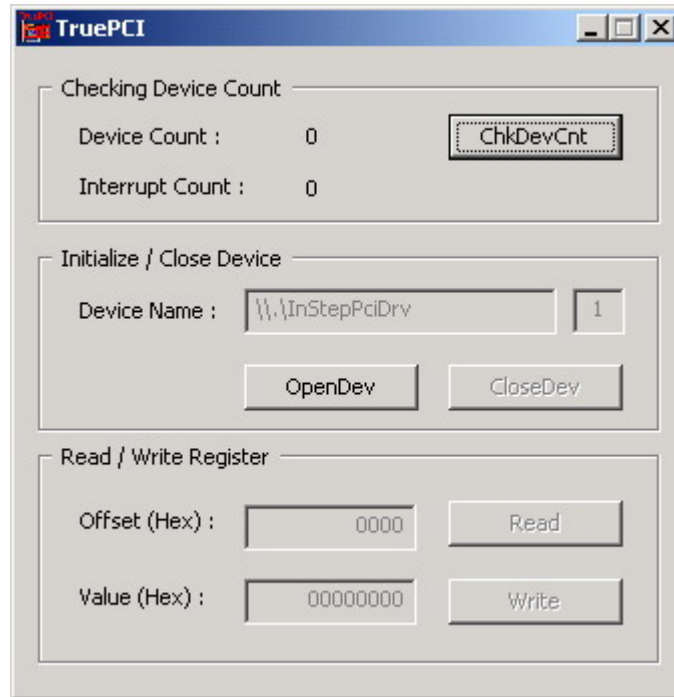

Figure 5-1 True PCI Demo Application

True PCI demo application has 3 main controls

1. Checking Device Count: Users can check how many True PCI card do install on user's PC by press "ChkDevCnt" button and True PCI demo application will display count number of True PCI card on "Device Count : ". And "Interrupt Count : " use for count external interrupt.
2. Initialize / Close Device: This main control use for open device and close device. Users should open device (press "OpenDev" button) before access True PCI card and close device (press "CloseDev" button) before closing demo application. If users do not open device, users can not access True PCI card.
3. Read/ Write Register: This main control reads or writes register. Offset means offset address from PCI base address (normally BIOS controls base address by itself) On True PCI card, Users can use address 0x0000 to 0x7FFF. For address 0x8000 to 0xFFFF reserve for PCI system register. Design Gateway Co.,Ltd do not guarantee any problem. If users access address in this range. In read access, Users can fill offset address to "Offset (Hex) : " and press "Read" button. True PCI demo application read data from address and show data in "Value (Hex) : ". In write access, Users can fill offset address to "Offset (Hex) : " and fill data to "Value (Hex) : " after that press "Write" button. True PCI demo application will send data to address

Note

True PCI demo application supports access True PCI only 1 card. If users installs True PCI more than 1 card, this application will not support additional cards.

## 6. Function in Dynamic Link Library (\*.DLL)

Design Gateway Co.,Ltd provides function library in DLL module (InStepPciDll.dll). Users can include DLL module to user's project and develop application based on example application.

### 6.1. True PCI Function

#### 1. Initial Device

Format	InitDevice (PCHAR pDevName, UCHAR DevNo, ULONG FlagOffset, ULONG FlgInterestBit, ULONG MskOffset, ULONG MskVal, UCHAR ClearFlagMode, UCHAR MaskMode, ULONG (*CBFn)( PVOID, PVOID, PVOID));	
Function	Initial True PCI card	
Parameter	PCHAR pDevName	Device name
	UCHAR DevNo	Device number
	ULONG FlagOffset	Interrupt Flag Register's offset
	ULONG FlgInterestBit	Interest bit Flag
	ULONG MskOffset	Interrupt Mask Register's offset
	ULONG MskVal	Interrupt Mask value
	UCHAR ClearFlagMode	Clear interrupt flag mode
	UCHAR MaskMode	Interrupt mask register mode
	ULONG (*CBFn)( PVOID, PVOID, PVOID)	Call back function for interrupt
Return Value	PVOID hHANDLE	Device's handle (Can open device)

#### Note

- In initial device function, all parameter use with initial PCI system. Design Gateway Co.,Ltd recommend users do not change this parameter.
- If application can not access to True PCI card, the return value equals NULL. On the other hand, if application can access to True PCI card, the return value does not equal NULL.

## 2. Check Device Count

Format	UCHAR ChkDeviceCnt (PCHAR pDevName);	
Function	Number of True PCI card	
Parameter	PCHAR pDevName	Device name want to check
Return Value	UCHAR	Number of True PCI card

### Note

- In check device count function, pDevName is "InStepPciDrv". Users do not change this name because this name is fixed.

## 3. Read Register

Format	ULONG reg_read (PVOID hHANDLE, ULONG offset);	
Function	Read data from True PCI card	
Parameter	PVOID hHANDLE,	Device's handle that returned from InitDevice
	ULONG offset	Offset address
Return Value	ULONG	Data value

## 4. Write Register

Format	VOID reg_write (PVOID hHANDLE, ULONG offset, ULONG val);	
Function	Write data to True PCI card	
Parameter	PVOID hHANDLE	Device's handle that returned from InitDevice
	ULONG offset	Offset address
	ULONG val	Data value
Return Value	-	-

## 5. Exit Device

Format	VOID ExitDevice (PVOID hHANDLE);	
Function	Disconnect to True PCI card	
Parameter	-	-
Return Value	-	-

## 6.2. Interrupt Process

After users enable external interrupt (write data 0x00000002 to address 0x0000), True PCI core will wait for external interrupt signal. When external interrupt occurred, True PCI core will set interrupt flag (address 0x0000 bit0). After windows detect interrupt flag that was be set. Windows will create interrupt event sent to application and clear interrupt flag in True PCI core. When application receives interrupt event, it will call "CallbackFunction". Which means "CallbackFunction" is interrupt service routine. In example code, "CallbackFunction" counts number of interrupt occurred and shows number at "Interrupt Count : "

## 7. How to install Device Driver

Please follow these steps to install True PCI device driver:

1. Turn off PC and then install True PCI card into PCI slot.
2. After turn on PC, "Found New Hardware Wizard" dialog (figure 7-1) will be occurs. Please select "Install from a list or specific location (Advanced)" and click at "Next".

Figure 7-1 "Found New Hardware Wizard" dialog

3. In select location of device driver dialog (figure 7-2), please select "X:\DeviceDriver" (X is CDROM drive) and click at "Next".

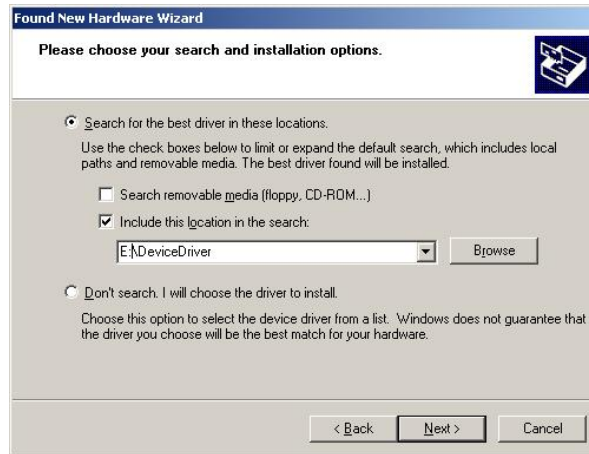

Figure 7-2 Select location of device driver

4. In warning dialog (figure 7-3), please click at “Continue Anyway”.

Figure 7-3 Click at “Continue Anyway”

5. In finish dialog (figure 7-4), please click at “Finish” to complete install device driver process.

Figure 7-4 Finish install device driver

## 8. Simulation model of PCI core

For simulating, the simulation model of PCI core, this requires “simprim” library. For Xilinx ISE Webpack version 6.3, the source files of “simprim” library are located at "C:\Xilinx\vhdl\src\simprims".

The source files are composed of:

- simprim\_Vpackage\_mti.vhd
- simprim\_Vcomponents\_mti.vhd
- simprim\_VITAL\_mti.vhd

Please create library “simprim” and compile these source files before simulating the simulation model of PCI core.

## 9. Synthesis PCI core

On True PCI's CD, there are example source codes of how to use PCI core. The example codes are composed of “TruePCI.vhd” and “UserInterface.vhd”. “TruePCI.vhd” is a top level module. “UserInterface.vhd” is a module that interfaces with PCI core. These two source files show the example of how to use PCI core. Users can modify both “TruePCI.vhd” and “UserInterface.vhd”. Anyway, Design Gateway Co.,Ltd recommends modifying only “UserInterface.vhd” because it is more convenient for users.
